

Suppose your training examples are sentences (sequences of words). Which of the following refers to the j^{th} word in the i^{th} training example?

 $x^{(i) < j >}$

We index into the i^{th} row first to get the i^{th} training example (represented by parentheses), then the j^{th} column to get the j^{th} word (represented by the

- $x^{< i > (j)}$
- $x^{(j) < i >}$
- $x^{< j > (i)}$

Consider this RNN:

This specific type of architecture is appropriate when:

 $T_x = T_y$

Correct

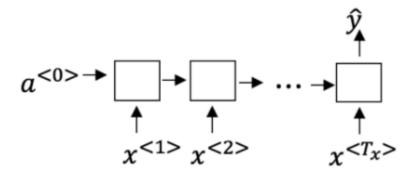

It is appropriate when every input should be matched to an output.

- $T_x < T_y$
- $T_x > T_y$
- $T_x = 1$

To which of these tasks would you apply a many-to-one RNN architecture? (Check all that apply).

1/1 points

Speech recognition (input an audio clip and output a transcript)

Un-selected is correct

Sentiment classification (input a piece of text and output a 0/1 to denote positive or negative sentiment)

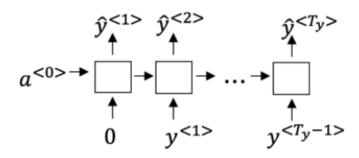

Correct

Image classification (input an image and output a label)

Un-selected is correct

 Gender recognition from speech (input an audio clip and output a label indicating the speaker's gender)

Correct

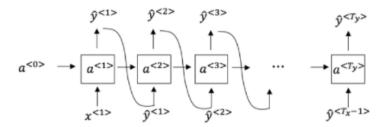

At the $t^{th}\,\,{\rm time}\,\,{\rm step},$ what is the RNN doing? Choose the best answer.

- $\bigcirc \quad \text{Estimating } P\left(y^{< t>} \mid y^{< 1>}, y^{< 2>}, \dots, y^{< t-1>}\right)$

Correct

- $\qquad \qquad \text{Estimating } P\left(y^{< t>} \mid y^{< 1>}, y^{< 2>}, \ldots, y^{< t>}\right)$
- 5. You have finished training a language model RNN and are using it to sample random sentences, as follows:

1/1 points

What are you doing at each time step t?

- (i) Use the probabilities output by the RNN to pick the highest probability word for that time-step as $\hat{y}^{< t>}$. (ii) Then pass the ground-truth word from the training set to the next time-step.
- (i) Use the probabilities output by the RNN to randomly sample a chosen word for that time-step as $\hat{y}^{< t>}$. (ii) Then pass the ground-truth word from the training set to the next time-step.
- (i) Use the probabilities output by the RNN to pick the highest probability word for that time-step as $\hat{y}^{< t>}$. (ii) Then pass this selected word to the next time-step.
- (i) Use the probabilities output by the RNN to randomly sample a chosen word for that time-step as $\hat{y}^{< t>}$. (ii) Then pass this selected word to the next time-step.

9 Here are the equations for the GRU and the LSTM:

GRU

LSTM

$$\begin{split} \tilde{c}^{< t>} &= \tanh(W_c[\Gamma_r * c^{< t-1>}, x^{< t>}] + b_c) \\ &\Gamma_u = \sigma(W_u[\,c^{< t-1>}, x^{< t>}] + b_u) \\ &\Gamma_u = \sigma(W_u[\,c^{< t-1>}, x^{< t>}] + b_u) \\ &\Gamma_r = \sigma(W_r[\,c^{< t-1>}, x^{< t>}] + b_r) \\ &\Gamma_f = \sigma(W_f[\,a^{< t-1>}, x^{< t>}] + b_f) \\ &\Gamma_f = \sigma(W_o[\,a^{< t-1>}, x^{< t>}] + b_f) \\ &\Gamma_o = \sigma(W_o[\,a^{< t-1>}, x^{< t>}] + b_o) \\ &\alpha^{< t>} = \Gamma_u * \tilde{c}^{< t>} + (1 - \Gamma_u) * c^{< t-1>} \\ &\alpha^{< t>} = \Gamma_u * \tilde{c}^{< t>} + \Gamma_f * c^{< t-1>} \\ &\alpha^{< t>} = \Gamma_o * c^{< t>} \end{split}$$

From these, we can see that the Update Gate and Forget Gate in the LSTM play a role similar to _____ and ____ in the GRU. What should go in the the blanks?

 Γ_u and $1 - \Gamma_u$

- Γ_u and Γ_r
- $1 \Gamma_u$ and Γ_u
- Γ_r and Γ_u

 You have a pet dog whose mood is heavily dependent on the current and past few days' weather. You've collected data for the past 365 days on the weather, which you represent as a sequence as $x^{<1>},\dots,x^{<365>}$. You've also collected data on your dog's mood, which you represent as $y^{<1>},\dots,y^{<365>}$. You'd like to build a model to map from x o y. Should you use a Unidirectional RNN or Bidirectional RNN for this problem?

- Bidirectional RNN, because this allows the prediction of mood on day t to take into account more information.
- Bidirectional RNN, because this allows backpropagation to compute more accurate gradients.
- Unidirectional RNN, because the value of y^{<t>} depends only on $x^{<1>}, \dots, x^{<t>}$, but not on $x^{< t+1>}, \dots, x^{<365>}$

Correct

Unidirectional RNN, because the value of $y^{<\!t>}$ depends only on $x^{<\!t>}$, and not other days' weather.
